Climate Change Profile: Benin

The expected impact of climate change in Benin, especially the projected rise in temperature and rainfall is likely to compound the challenges already faced by the agriculture and forestry sectors, while the coastal areas will experience a sharp rise in sea level. The latter will threaten the people living along the coast where both income and population density is higher (between 250 and 1000 p/km², half of the population) than in other parts of Benin (from 0 to 250 p/km²). Both biophysical and socio-economic vulnerability is high due to limited adaptive capacity. Since agriculture is of the greatest importance for the Beninese economy, the agricultural sector will need to adopt adaptive measures in order to respond to the consequences of climate change that threaten food security.

Overall ranking

Benin ranks 151 out of 180 countries in the ND-GAIN index¹ (2014), which is unchanged compared to its 2013 ranking (also 151). Benin is the 20th most vulnerable country and the 52nd least ready country – meaning that it is vulnerable to, yet unready to combat climate change effects. *Vulnerability* measures the exposure, sensitivity, and ability to cope with climate related hazards by accounting for the overall status of food, water, environment, health, and infrastructure within a country. *Readiness* targets those portions of the economy, governance and society that affect the speed and efficiency of adaptation.

Biophysical vulnerability

Current climate. Benin is located in West Africa and its climate is influenced by the Inter-Tropical Convergence Zone (ITCZ), creating both winds from the Ocean as well as winds from the Sahara region that are dustier and warmer². These two opposing wind directions cause the annual West African Monsoon – resulting in a wet **season** in the north of Benin from May to November, and two wet seasons from March to July and from September to November in the southern regions of Benin³. In general, most of the country experiences transitional tropical conditions, with less rainfall than in other areas at the same latitude – a climate known as the Benin variant⁴. For the whole of Benin, the annual mean **temperature** is 27°C, whereas the annual total **precipitation** is 1150 mm⁵.

Current trends. The mean average **temperature** has increased since 1960 by 1.1°C and the average number of ‘hot’ days⁶ per year in Benin increased by 39 between 1960 and 2003, and

¹ GAIN index summarizes a country’s vulnerability to climate change and other global challenges in combination with readiness to improve resilience. <http://index.gain.org/country/benin>

⁵ Climate Service Center (2015): Climate fact sheet Benin, Ghana, Togo <http://www.climate-service-center.de/>

⁶ ‘Hot’ day or ‘hot’ night is defined by the temperature exceeded on 10% of days or nights in current climate of that region and season (see footnote 2).

hot nights by 73 in the same period⁷. In contrast, the frequency of ‘cold’ days and nights⁸, annually, has decreased significantly since 1960. Since the end of the 1960s the climate perturbations have increased in Benin, which has manifested in reduced annual amplitude of rains by 180 mm⁹, see [Map 1](#). In addition, **droughts** have intensified during the same period, especially in the 1970s and 1980s, and rains have intensified by 100 mm/h enhancing soil **erosion and floods**¹⁰. Moreover, the annual count of wet days as well as the annual maximum 30-day total rainfall showed a substantial decrease over the 1960–2000 period¹¹.

Climate change. Northern regions are especially threatened by encroaching deserts; the borderline of which gradually shifts to the lower latitudes, while the agricultural production capacity in the intensively cultivated south is endangered by nutrient mining (unreplenished removal by crops of nutrients such as phosphorous, nitrogen, and potassium). Under climate change, this situation is most likely to worsen, with accelerated **desertification** in the north and more frequent occurrence of torrential rains and **floods** in the south, but much less in the Middle Belt. The most notable climate risks are drought, late and intensive rains, and floods, in addition to extreme winds¹². See [Map 2](#) for projected **precipitation** change under different climate change scenarios.

Climate models project an increase in the normal annual maximum **temperature** for the whole country, ranging from slight (1–1.5°C) to substantial (2.5–3.0°C)¹³, see [Map 3](#). The mean annual temperature is projected to increase by 1.0 to 3.0°C by the 2060s, and 1.5 to 5.1°C by the 2090s. The range of projections by the 2090s under any emissions scenario is around 2.0–2.5°C¹⁴. With the current rate of **wetlands destruction** (due to human intervention), the coastal wetland is projected to reduce by 40% by 2080. **Sea levels** are expected to rise by 0.4 to 0.7 meters by 2100, probably resulting in coastal disasters (complete coastal erosion, floods, and storm waves)¹⁵.

The negative consequences of intense and successive periods of drought and floods could affect **food security**: they may reduce the production of food by 6% by 2025 if no adaptive measures are taken⁴. As for **water resources**, the consequences of climate change (decline of precipitation) could result in 40% to 60% reduction in the availability of water resources, further influencing Benin’s food production¹⁶, see [Map 4](#). Moreover, according to the Global Climate Change Alliance (GCCA) the consequences of the degradation and destruction of gallery forests

⁷ McSweeney et al. (2010)

⁸ ‘Cold’ days or ‘cold’ nights are defined as the temperature below which 10% of days or nights are recorded in current climate of that region or season (see footnote 2)

¹⁶ Climate Service Center (2013)

in the Ouémé river basin – caused by charcoal non-sustainable timber extraction and extensive fallow-based agricultural practices – is being exacerbated by climate change¹⁷. This is not only a significant problem for forest-dependent communities, but also for downstream regions, which increasingly suffer from devastating floods during the rainy season.

Socio-economic vulnerability

Key facts:

GDP (PPP) per capita (2015) ¹⁸ :	USD 2,109.8
Population (June 2016) ¹⁹ :	11,144,734
Projected population (2050) ²⁰ :	22,544,900
Population density per km ² (2015) ²¹ :	94
Human Development Index (2014) ²² :	166 out of 188 countries
Corruption Perceptions Index (2015) ²³ :	83 out of 168 countries
Gender Inequality Index (2014) ²⁴ :	166 out of 188 countries
Adult literacy (2015) ²⁵ :	38.4% (male 49.9%; female 27.3%)

Agriculture is an important economic sector in Benin and contributes 36.3% of the GDP and employs around 70% of the population²⁶. The major staple food crops are yams, cassava, and maize, and the major cash crops are seed, cotton, and cashew nuts²⁷. Since agriculture is especially vulnerable to its consequences, climate change will disproportionately affect the poor, who depend on agriculture for their livelihoods and who have less capacity to adapt²⁸. Without adaptive measures such as enhanced crops and improved irrigation²⁹, agricultural production is expected to decrease by 3 to 18% in 2025. However, the high percentage of households in poverty (in 2011, 36.2% of the population estimated at or below the national poverty line³⁰) may limit investment and hinder adoption of adaptive measures. The most vulnerable socio-economic groups are small-scale cattle herders, smallholder farmers and fishermen; smallholder farmers and small-scale cattle herders are to some extent interdependent since herders may depend on farms for the feed for their cattle, partly covered by post-harvest grazing. There is also a gender dimension to climate change: a study focusing on dry grains found

³⁰ World Bank data (2014): http://data.worldbank.org/country/benin#cp_wdi

that only 28% of the households surveyed that are headed by women were able to cover the basic annual needs of their families compared to 43% of male-headed households. As a result of the consequences of climatic changes, the self-sufficiency of rural households headed by women will be even lower³¹.

Some climate change scenarios show that parts of the most productive zones for staple crops (north, north-west, and centre) could experience reduced precipitation as well as an average increase of 2°C in temperature, with substantial negative effects on staple yields (e.g., a decline of 5–25% for maize)³². The lengthening of the dry season has an overall effect on agricultural production. Net exports of maize are shown to increase due to favourable changes in climate for large-scale maize production in combination with economic developments, whereas for tubers and root crops (yams, sweet potatoes, cassava, and others), imports will grow: cassava production and yields are shown to improve until 2030 and then stagnate, at between 3 and 4 million metric tons and at just over 15 tons per hectare, respectively³³. For yams and sweet potatoes, results of studies and climate models vary: some models project an increase, others a decrease of yield. Most likely is that yam yield will decline significantly during the period 2041–2050 ranging from 18 to 33%³⁴. Reduction in yam yield is not explainable by the change in temperature but due to a decline in precipitation. Net imports of crops are expected to increase slightly³⁵ which could compensate the food availability. Concerning the impact of climate change on cotton cultivation, it is expected that yield will decrease due to insufficient and unequal rainfall, potentially leading to crop diversification.

As for the other sectors: a rising sea level and increased coastal erosion are threatening poor communities living along the urbanised coast and the sensitive coastal ecosystems. In the future, this is expected to lead to population migration, disease outbreaks, and to contribute to food shortages. Overall, the coastal, north-western, and far northern zones of Benin are considered to be particularly vulnerable to the impacts of climate change³⁶.

National government strategies and policies

In Benin at the institutional level, the creation of a Directorate for Climate Change Mitigation and Promoting Green Economy Ministry in charge of climate change and an Energy Directorate New and Renewable Ministry in charge of energy, provide a technical framework for the promotion and coordination of climate action³⁷. The development and implementation of policy on climate change and agriculture is positioned within two national Ministries: the Ministry of

³⁷ <http://www4.unfccc.int/submissions/INDC/Published%20Documents/Benin/1/INDC%20BENIN%20%20Version%20finale%20revue%20septembre%202015.pdf>

Environment and Protection of Nature (MEPN) and the Ministry of Agriculture, Livestock and Fisheries (MAEP)³⁸.

Numerous action plans and policy documents have been formulated by the Government of Benin, including Agenda 21, Benin 2025, the Agreement on Sustainable Development, and several reforestation programmes, as well as an Initial and Second National Communication document on climate change that are currently under implementation. Benin also ratified the UN Convention on Biological Diversity (CBD) in 1994 for which it had a National Biodiversity Strategy and Action Plan approved in 2002³⁹, the Convention to Combat Desertification (CCD) in 1996 for which it developed a National Action Programme in 2000⁴⁰, and the Framework Convention on Climate Change (UNFCCC) in 1994⁴¹.

Reflecting its development priorities, Benin emphasizes the need in its climate change actions to alleviate extreme poverty and promote economic growth⁴². These priorities are reflected in its Initial National Communication (2002) and its National Adaptation Programme of Action (NAPA, 2008). The first phase is called 'Integrated adaptation programme for the fight against the damaging effects of climate change for the agricultural production and food security in Benin'. This phase started in January 2010 and is still under implementation. Its focus is on the four most climate vulnerable agro-ecological zones of Benin: zone 1: Extreme Nord (Malanville), zone 4: West Atacora-Donga (Ouaké, Matéri), zone 5: Central coastal zone (Savalou, Aplahoué), zone 8: fisheries zone (Ouinhi, Bopa, Adjohoun, and Sô-Ava), see [Map 5](#). The general objective is to strengthen the capacity of agricultural communities in order to make them adaptive to climate change. Anticipated results are the establishment of nine executive Community Committees for Technical Coordination, cultivation of short cycle crops, studies, and validation workshops. Achieved performance so far is between 77% (physical annual measures) and 93% (annual financial execution)⁴³. The Adaptation Partnership, a USAID supported platform on climate adaptation, identified the gaps in current adaptation action: they appear to be in coastal zone management, maintenance of freshwater resources, forestry, and energy. Gender does not constitute a significant component of any current adaptation or proposed projects⁴⁴.

The priority projects as submitted to the UNFCCC⁴⁵ have a slightly different focus than the options formulated in the NAPA⁴⁶. In the NAPA, agricultural production systems and climate-related diseases protection were priorities. In the projects submitted to the UNFCCC, these are less explicitly mentioned. Submitted projects are:

⁴⁶ UNDP; Beninese Ministry of Environment and Nature Protection (2008)

- implementation of a forecasting system for early warning and climatic risks for food security in four vulnerable agro-ecological regions;
- climate change adaptation of households through awareness-raising and capacity building on solar energy and efficient stoves in areas vulnerable to climate change and with degraded soils;
- exploitation of surface water as a means to adapt to climate change in the most vulnerable areas in the Centre and North Provinces;
- malaria protection for children and pregnant women in areas most vulnerable to climate change;
- protection of coastal areas against sea level rise.

Currently, Benin receives support from UNDP to move its National Adaptation Plan (NAP) forward. A team of UNDP consultants held several meetings with Benin's government. An inception workshop took place in the first quarter of 2015 and the GCF readiness programme was launched⁴⁷.

In addition, Benin communicated three Nationally Appropriate Mitigation Actions (NAMAs) to the UNFCCC that are currently being translated into concrete projects:

- the development of an urban transport system in greater Cotonou to reduce GHG emissions;
- the sustainable development of natural forests and forest planting to strengthen carbon sinks;
- recovery of CH₄ (methane) emitted by landfills in local communities with a special status (Cotonou and greater Cotonou, Porto-Novo and Parakou)⁴⁸.

In 2011, Benin joined the UN Climate Change Learning Partnership (UN CC: learn). In 2013, Benin finalized a National Climate Change Learning Strategy⁴⁹. Other milestones, mainly focusing on capacity building, are trainings on climate negotiations (2014) and climate finance (2013 and 2016)⁵⁰.

Intended Nationally Determined Contributions (INDC) ⁵¹

In its Intended Nationally Determined Contribution (INDC) Benin presents itself as being highly vulnerable to the effects of climate change. Benin plans to reduce its emissions (excluding the forestry sector) by approximately **21.4 %** during the period 2021–2030 compared to the Business-as-Usual (BAU) scenario. Of 21.4 % decrease in emissions, **3.5 % is unconditional** (through national efforts and **17.9 % is conditional** on international finance. Reducing the annual rate of deforestation will make an additional contribution to lowering emissions, but will heavily depend on conditional funding⁵². Benin estimates that to achieve its ambitious emissions targets and adapt to the adverse effects of climate change, it would need an overall budget of about **USD 30.13 billion** (2021–2030) of which the government would be able to contribute **USD 2.32**

⁵⁰ UN Climate Change Learning Partnership: <http://www.uncclearn.org/node>

⁵¹ INDC Benin, <http://www4.unfccc.int/submissions/INDC/Published%20Documents/Benin/1/INDC%20BE-NIN%20%20Version%20finale%20revue%20septembre%202015.pdf> and <http://climateobserver.org/open-and-shut/indc/>

⁵² [Measures proposed in the INDC for LULUCF include reducing the rate of deforestation and implementing a reforestation plan with the goal of creating 15,000 ha forest plantation annually.](#)

billion (unconditional) and additional international funds providing the remaining USD **27.81 billion (conditional)**. Of the USD 30.13 billion, an estimated USD 12.13 billion would be needed for mitigation and USD 18 billion for adaptation⁵³. The INDC highlights that for implementation Benin will require financial support, technology transfer (especially in agriculture/forestry, energy, waste and transport) and capacity building. The INDC presents objectives for the energy sector (e.g. use of renewables (hydro and solar), dual-fuel power plants, and for agriculture (e.g. improved crop cultivation techniques, crop management, agro-forestry and conservation of national forests).

Climate finance

In the last decade, there have been numerous projects and programmes financed by donors aimed at improving Benin's climate preparedness, including tree plantations, capacity building of national and local governmental institutes, and agricultural strategy development. Donors include international organisations such as UNDP, World Bank, DFID, IDRC, French/German/Danish/Dutch Ministries of Foreign Affairs, LDCF, and GIZ. Overall, the majority of climate change related projects in Benin are financed by French institutions (ministries, research institutes NGOs etc.) that are in some cases also involved in the implementation⁵⁴. The largest donor for overall development in Benin is the European Union (372 million Euros in the 11th European Development Fund) investing mainly in sustainable agriculture and energy and good governance⁵⁵. As for climate funds utilization: according to the Overseas Development Institute (ODI), Benin received USD 22,850,000 in climate funds between 2004 and 2014 – placing it at number 51 of the climate finance approved ranking list of 135 countries⁵⁶. With support of UN CC: learn, Benin works to strengthen its capacity to access climate funds⁵⁷.

Benin is a pilot country for the inception phase of the Green Climate Fund (GCF) Readiness Programme. It is expected that on-stream investment from the private sector in climate change adaptation will occur after the pipeline of vital and viable national projects drawn from national climate change strategies, plans and policies has been developed⁵⁸. This access programme is coordinated through UNDP and the World Resources Institute (WRI). The National Adaptation Plan Global Support Programme (NAP-GSP) is linking with the GCF Readiness Programme to maximize opportunities to coordinate adaptation actions in Benin.

Benin joined the GEF in April 1994 and completed GEF enabling activities (to qualify for funding from GEF), including a NAPA, National Biodiversity Strategy and Action Plan (NBSAP) and country self-assessment. In total, it has been allocated USD 13,600,270 for biodiversity projects USD 34,782,091 for climate change, and USD 15,658,158 for multi focal area projects⁵⁹.

Currently, an investment plan for funding from Scaling Up Renewable Energy in Low Income Countries Program (SREP, a funding window of CIF) programme, is under development⁶⁰.

Climate change projects

Projects in Benin that are involved in climate change adaptation and mitigation in relation to water and food security are numerous. Below follows a selection of the main programmes currently under implementation:

- a number of projects in the energy sector to reduce the use of coal and promote climate-friendly energy sources, financed by the World Bank⁶¹;
- '2SCALE'⁶² funded by the Netherlands Ministry of Foreign Affairs (2012–2017), aiming to improve rural livelihoods and food and nutrition security in Africa by creating partnerships to enable farmers and entrepreneurs to grow together in their agribusiness⁶³;
- several food security and disaster risk reduction projects supported by the World Food Programme (WFP)⁶⁴;
- several climate relevant programmes executed by GIZ, including: 1) 'Adapting agriculture to climate change' (PACC) (2014–2019), a project aimed at sustainable management of natural resources, in particular of water and soil, to help those agricultural areas of northern Benin most affected by climate change better adapt to these changes; 2) 'Trans boundary Biosphere Reserve in the Mono Delta' (2013–2019), a project that aims to protect natural resources, particularly biodiversity, and promotes natural resources use in a sustainable manner; and 3) 'Integrated management of water resources and water supply' (2014–2017), aiming at ensuring water access by intervening in the interrelationship between water, climate change and food security⁶⁵;
- a GCCA programme for reduction of flood impacts (2012–2017), notably by promoting the conservation and sustainable use of gallery forests in the lower valley of the Ouémé River and by equipping Benin with basic geographic information systems (GIS) and cartographic equipment in support of improved forest and land management, with the objective to inform the Growth strategy for Poverty reduction, the National Environmental Management Programme and the National Action Programme of Adaptation to climate change⁶⁶.

The following regional programmes with a focus on food security and/or water are also being implemented in Benin:

- the 'Adaptation Learning Programme for Africa' (2010–2017), executed by CARE, is aiming to increase the capacity of vulnerable households in Sub-Saharan Africa to adapt to climate variability and change and supported by the United Kingdom's Department for International Development (DFID), The Ministry of Foreign Affairs of Denmark, The Ministry of Foreign Affairs of Finland and the Austrian Development Cooperation⁶⁷;

⁶⁴ World Food Programme (WFP) (2015) <http://www.wfp.org/countries/benin>

⁶⁵ GIZ (2015): Benin. <https://www.giz.de/en/worldwide/342.html>

⁶⁶ GCCA (2013)

⁶⁷ CARE Climate Change Information Centre (2014): *Adaptation Learning Programme for Africa*, <http://www.careclimatechange.org/adaptation-initiatives/alp>

- ‘Great Green Wall’ financed by Multi Trust Fund (GEF), SCCF, World Bank, AfDB. The concept was approved of in 2011, however, the implementation phase has not started yet⁶⁸;
- ‘Programme to Build Resilience to Food and Nutrition Insecurity in the Sahel’ (P2RS) (2014–2019) funded by the African Development Bank in a move aimed at ending the frequent cycles of drought and famine in the Sahel region⁶⁹;
- regional programmes executed by GIZ, including 1) ‘Promotion of a climate–friendly inter–connected power system in West Africa’ (2013–2016), aiming at creating key conditions for a climate–friendly interconnected power system in the ECOWAS region; and 2) ‘Energising Development (EnDev) – Programme for Energy Access’ (2005–2019), aiming at the development of commercial markets for the diffusion of renewable energies and energy–efficient technologies for households, public and social institutions, and small and medium–sized enterprises⁷⁰.

For a complete list of projects in Benin funded through bilateral/multilateral climate funds, see the list in the [Annex](#).

Climate contribution of the Netherlands Embassy: Pitch & Bid

Beginning in 2014, embassies with development programs prepare an annual climate Pitch & Bid. The *Pitch* communicates the embassy’s climate–smart actions that will address climate change. Based on the actions described in the Pitch, assignment of the Rio Markers and budget information, the embassy prepares a *Bid* which is an estimate of how much it is likely to spend on projects that are relevant for climate in the coming three years. For Benin the Bid estimates a climate contribution for 2016–2018 of €31 million (6,353.000 for 2016; 12,697.000 for 2017; 12,307.00 for 2017). Of this, all projects contribute to adaptation with 39% contributing to both *adaptation and mitigation*:

- **integrated water resources management (IWRM) and Delta Plan**: disaster risk reduction in urban areas along the coast will be enhanced through the introduction of the Delta approach in the Ouémé Basin, while support to a National Water Institute (INE Benin) will help the country to deal with the uncertain effects of climate change; INE Benin aims to build national capacity concerning data collection, hydraulic modelling and advisory services, as a sustainable response to climate change challenges.
- **new water and energy sources**: a change from ground water to surface water as a source for drinking water will contribute to climate adaptation, while a shift from fossil fuels to solar energy by financing the use of solar technology to secure production, contributes to mitigation;
- **rural infrastructure**: remote rural areas that are often isolated during rainy spells will have better access to markets, production areas and health facilities through improved road and water infrastructure;
- **innovative adaptation for food security and businesses**: innovative practices that improve both food security and business development options will be researched and supported, e.g. the production of biofuels on an experimental basis in order to generate revenue at a local level while producing a clean source of energy.

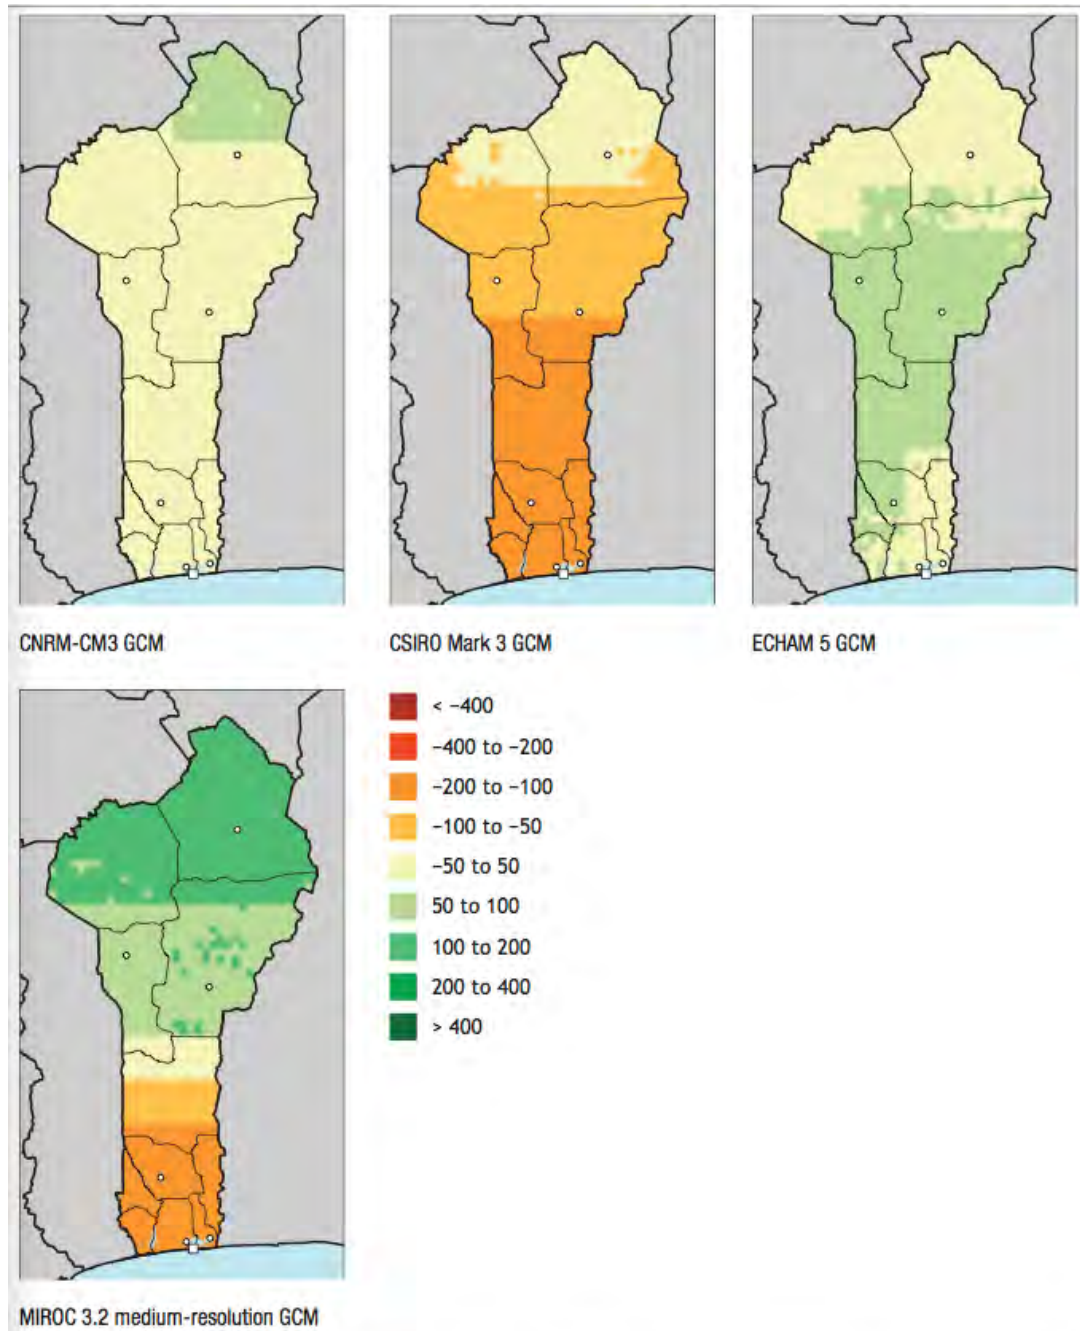

Map 1: Frequency of years of extreme rainfall deficiency in Benin

Source: Yabi and Afouda (2011), retrieved from Konrad Adenauer Stiftung, *Les Enjeux du Changement Climatique au Bénin*

Legend: The clearer colours (upper half of legend) indicate a high number of 'bad' years where the pluviometric deficit is higher than or equal to 30%. Years: 1951 - 2010.

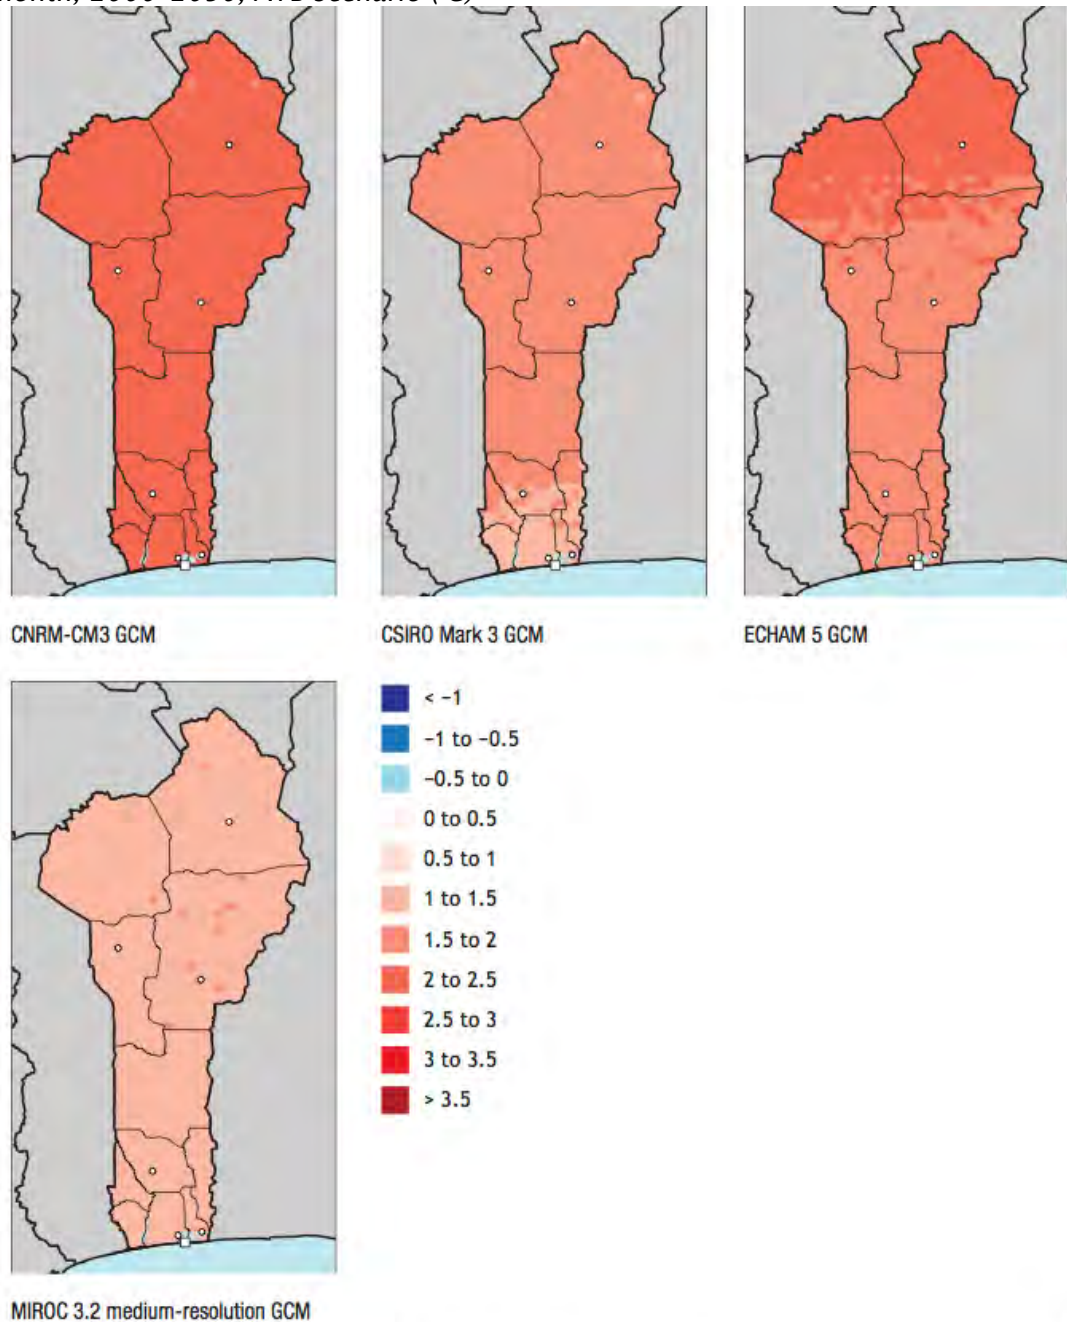

Map 2: Changes in mean annual precipitation in Benin, 2000–2050, A1B scenario (millimeters)

Source: Authors' calculations based on Jones, Thornton, and Heinke (2009).

Notes: A1B = greenhouse gas emissions scenario that assumes fast economic growth, a population that peaks midcentury, and the development of new and efficient technologies, along with a balanced use of energy sources; CNRM-CM3 = National Meteorological Research Center–Climate Model 3; CSIRO = climate model developed at the Australia Commonwealth Scientific and Industrial Research Organisation; ECHAM 5 = fifth-generation climate model developed at the Max Planck Institute for Meteorology (Hamburg); GCM = general circulation model; MIROC = Model for Interdisciplinary Research on Climate, developed by the University of Tokyo Center for Climate System Research.

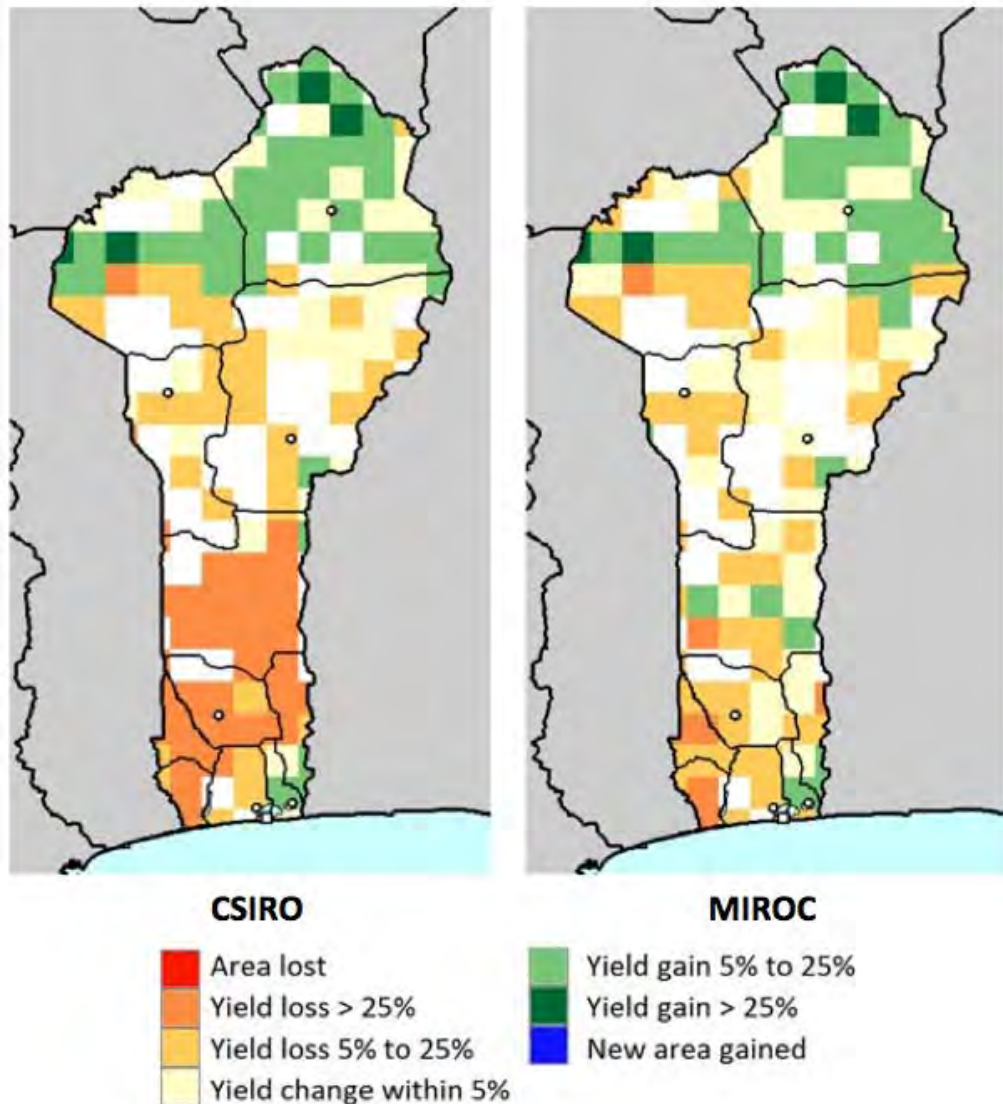

Map 3: Change in monthly mean maximum daily temperature in Benin for the warmest month, 2000–2050, A1B scenario (°C)

Source: Authors' calculations based on Jones, Thornton, and Heinke (2009).

Notes: A1B = greenhouse gas emissions scenario that assumes fast economic growth, a population that peaks midcentury, and the development of new and efficient technologies, along with a balanced use of energy sources; CNRM-CM3 = National Meteorological Research Center–Climate Model 3; CSIRO = climate model developed at the Australia Commonwealth Scientific and Industrial Research Organisation; ECHAM 5 = fifth-generation climate model developed at the Max Planck Institute for Meteorology (Hamburg); GCM = general circulation model; MIROC = Model for Interdisciplinary Research on Climate, developed at the University of Tokyo Center for Climate System Research.

Map 4: Changes in yields under climate change: rain-fed maize

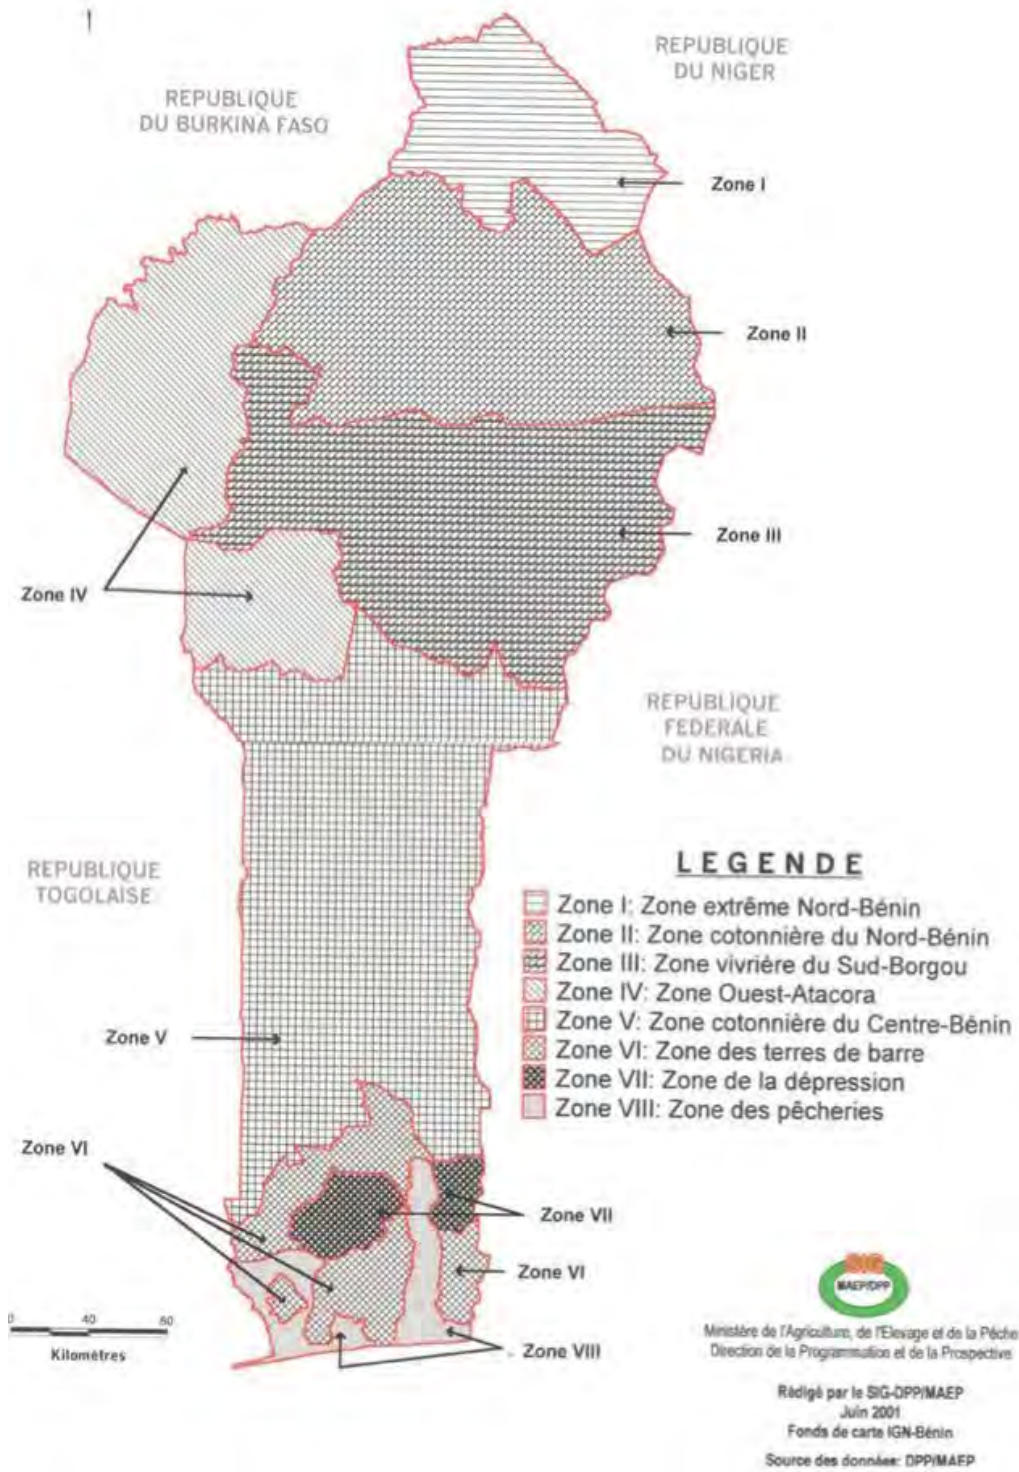

Source: Emmanuel A. Lawin, P. B. Irénikatché Akponikpè, Abdulai Jalloh, and Timothy S. Thomas, December 2012, *West African agriculture and climate change: A comprehensive analysis – Benin*

The maps above depict the results of the Decision Support System for Agro technology Transfer (DSSAT) crop modelling software projections for rain-fed maize, comparing crop yields for 2050 with climate change to yields with 2000 climate. The data indicate a slight yield increase of 5–25 percent in the north. For the central and the southern parts of the country (covering the most productive zone of maize), the MIROC⁷¹ model shows mostly yield reductions of 5–25 percent. The CSIRO⁷² model predicts even greater reduction in maize yields, exceeding 25 percent. No area is lost.

⁷¹ Model for Interdisciplinary Research on Climate (MIROC) is a coupled general circulation model and consists of five component models: atmosphere, land, river, sea ice, and ocean (http://ccsr.aori.u-tokyo.ac.jp/~hasumi/mi-roc_description.pdf)

⁷² Comprehensive climate system model developed by the Commonwealth Scientific and Industrial Research Organisation (CSIRO) including atmosphere, land surface, ocean, and polar ice (http://www.cawcr.gov.au/publications/technicalreports/CTR_021.pdf).

Annex: List of projects in Benin under bilateral and multilateral climate funds

Source: *Climate Funds Update (updated May 2016)*: <http://www.climatefundsupdate.org/data>

Name of Project	Fund	Funding Approved (USD millions)	Disbursed (USD millions)	Fund Type
Projet d'Appui au Développement du Maraîchage au Bénin (PADMAR)	Adaptation for Smallholder Agriculture Programme (ASAP)	4.5	0	Multilateral
Adaptation to climate change in Benin – Providing a reliable base mapping and fighting floods by preserving and developing gallery forests	Global Climate Change Alliance (GCCA)	8.97	2.9	Multilateral
Integrated Adaptation Programme to Combat the Effects of Climate Change on Agricultural Production and Food Security	Least Developed Countries Fund (LDCF)	3.2	3.2	Multilateral
Flood Control and Climate Resilience of Agriculture Infrastructures in Oueme Valley– Benin	Least Developed Countries Fund (LDCF)	7.5	7.5	Multilateral
Strengthening Climate Information and Early Warning Systems in Western and Central Africa for Climate Resilient Development and Adaptation to Climate Change – Benin	Least Developed Countries Fund (LDCF)	4.1	4.1	Multilateral
Strengthening the Resilience of Rural Livelihoods and Sub–National Government System to Climate Risks and Variability in Benin	Least Developed Countries Fund (LDCF)	4.5		Multilateral

Name of Project	Fund	Funding Approved (USD millions)	Disbursed (USD millions)	Fund Type
Project for the Elaboration of the National Programme of Action for Adaptation for Climate Change (NAPA)	Least Developed Countries Fund (LDCF)	0.2	0.2	Multilateral
Benin Energy Efficiency Program	Global Environment Facility (GEF4)	1.8	1.8	Multilateral
Improving Mobility in Parakou	Global Environment Facility (GEF6)	1.8	1.8	Multilateral
Strengthening the Resilience of the Energy Sector in Benin to the Impacts of Climate Change	Least Developed Countries Fund (LDCF)	8.2		Multilateral
Preparation of Benin's First Biennial Update Report (BUR1) to UNFCCC	Global Environment Facility (GEF5)	0.4	0.4	Multilateral
Readiness program support	Green Climate Fund (GCF)	0.2		Multilateral
Scaling Up Renewable Energy in Low Income Countries	CIF/SREP	plan under development		Multilateral
Additional Financing for Forest and Adjacent Land Management ⁷³	World Bank	5.6		Multilateral
Additional Financing for Forest and Adjacent Land Management II ⁷⁴	World Bank	2		Multilateral
Agricultural Productivity and Diversification ⁷⁵	World Bank	31		Multilateral
Access to Modern Energy ⁷⁶	World Bank	70		Multilateral
