betreft Slagschaduwberekening Bedrijventerrein De Geer, Oss

Aanleiding

In het MER *Windmolenpark Elzenburg – De Geer te Oss, 2017* zijn de effecten van een windmolenpark nabij Oss op de omgeving onderzocht. Onderdeel hiervan zijn de slagschaduweffecten. Het draaien van de wieken van een windmolen kan op momenten dat de zon schijnt leiden tot bewegende schaduw, de zogenaamde slagschaduw. Indien deze schaduw valt op woningen of kantoren kan dat als hinderlijk worden ervaren. In het MER zijn de effecten op woningen in de omgeving onderzocht.

Slagschaduw kan ook hinder geven op bedrijven. Dit is afhankelijk van de locatie van de bedrijven, waar het kantorengedeelte in de bedrijven zich bevindt en de oriëntatie van de ramen. Het Rarim (Activiteitenregeling Milieubeheer) heeft geen regels opgenomen over slagschaduw op bedrijven en kantoren, er gelden geen wettelijke normen voor slagschaduw op deze objecten. Om toch de effecten op kantoren inzichtelijk te maken zijn, in aanvulling op het MER, de slagschaduweffecten op elf bedrijven op bedrijventerrein De Geer te Oss onderzocht.

Slagschaduwberekening

Voor de locatie De Geer zijn de slagschaduweffecten van alternatief VKA 2a uit het MER berekend. Hierbij is gebruik gemaakt van windturbintype Nordex N131. Voor de berekeningen is gebruik gemaakt van het softwarepakket WindPro, In WindPro is op basis van een reële gemiddelde klimaat-, weer- en zonneverwachting voor het alternatief de 0 uur, 5 uur¹ (maat voor wettelijke norm) en 10 uur kans op slagschaduw per jaar contour berekend. De berekeningen geven vier klassen slagschaduw:

- 0 uur slagschaduw per jaar: objecten buiten de 0 uur contour hebben geen (kans op) slagschaduw (op basis van een reële gemiddelde klimaat-, weer- en zonneverwachting);
- 0 tot 5 uur slagschaduw per jaar: objecten tussen de 0 en 5 uur contour hebben kans op 0 tot 5 uur slagschaduw per jaar en daarmee per definitie minder kans op slagschaduw dan de wettelijke norm;
- 5 tot 10 uur per jaar: objecten tussen de 5 en 10 uur contour hebben kans op 5 tot 10 uur slagschaduw per jaar en daarmee meer kans op slagschaduw dan de wettelijke norm.
- > 10 uur slagschaduw: objecten binnen de 10 uur contour hebben kans op meer dan 10 uur slagschaduw per jaar en daarmee meer kans op slagschaduw dan de wettelijke norm.

In figuur 1 zijn de bovenstaande contouren weergegeven. Van de elf locaties op bedrijventerrein De Geer bevinden zich er tien binnen de 10 uur contour. De rekenresultaten zijn gespecificeerd naar de turbines en uren waarop de slagschaduw optreedt op het kantorengedeelte van de bedrijfslocaties. Deze resultaten zijn als bijlage toegevoegd.

¹ Commissie m.e.r. vraagt op 6 uur contour, 5 uur contour is veiliger, want scherper (norm ligt op 5 uur 40 minuten)

Figuur 1: Slagschaduwcontouren alternatief VKA 2a, met aanduiding bedrijven

Resultaten

Op de kantoorlocaties geldt een verwachte slagschaduw van circa een half uur tot 144 uur en 6 minuten per jaar. Windmolen 5 levert hier de grootste bijdrage aan, zie tabel 1. Windmolen 4 levert op geen van de bedrijven slagschaduw op. In tabel 1 zijn de resultaten samengevat weergegeven. In de bijlagen zijn uitdraaien met detailinformatie opgenomen. In bijlage 1 is een leeswijzer opgenomen waarin de navolgende bijlagen en informatie daarin worden toegelicht.

Tabel 1: Verwachte kans op slagschaduw op bedrijventerrein De Geer, per bedrijfslocatie

1. Leeswijzer resultaten slagschaduwberekening

Uitgangspunten rekenresultaten

- Voor de slagschaduwberekeningen wordt gebruik gemaakt van het softwarepakket WindPro. De resultaten van de berekeningen worden weergegeven op een hoofdpagina (main result), slagschaduwkalenders per receptor en windturbines en grafische kalenders per receptor en windturbines.
- De eventuele schaduw van een windturbine op een grotere afstand dan twaalf maal de rotordiameter wordt verwaarloosd;
- Schaduw bij een zonnestand lager dan drie graden wordt als niet-hinderlijk beoordeeld. Bij zonsopgang en zonsondergang is het licht vrij diffuus en wordt de turbine vaak aan het zicht onttrokken door gebouwen en begroeiing;
- Binnen een afstand van circa 350 tot 400 m vanaf een de turbine kan de zon volledig bedekt worden door een rotorblad. De rotor moet dan haaks staan op de richting van de zon. De schaduw is dan maximaal en wordt als meer hinderlijk ervaren;
- Bij de bepaling van de schaduwduren is geen rekening gehouden met eventuele beplanting en gebouwen die het zicht kunnen belemmeren. Hierdoor kan de hinder minder zijn.
- Bij een windpark worden de schaduwuren en schaduwdagen van afzonderlijke turbines opgeteld voor zover de schaduwen elkaar niet overlappen;
- Er is volgens het Activiteitenbesluit een stilstandsvoorziening op een turbine nodig als de gemiddelde duur van hinderlijke schaduw gemiddeld meer is dan 17 dagen per jaar gedurende meer dan 20 minuten per dag. Omgerekend is dit 5 uur en 40 minuten per jaar.

Main result (bijlage 3)

Slagschaduwcontouren

In WindPro wordt op basis van een reële gemiddelde klimaat-, weer- en zonneverwachting de 0 uur, 5 uur en 10 uur kans op slagschaduw per jaar berekend. Deze berekeningen leveren drie slagschaduwcontouren op en geven vier klassen slagschaduw:

- 0 uur slagschaduw per jaar: objecten buiten de 0 uur contour hebben geen (kans op) slagschaduw (op basis van een reële gemiddelde klimaat-, weer- en zonneverwachting);
- 0 tot 5 uur slagschaduw per jaar: objecten tussen de 0 en 5 uur contour hebben kans op 0 tot 5 uur slagschaduw per jaar en daarmee per definitie minder kans op slagschaduw dan de wettelijke norm uit het Activiteitenbesluit;
- 5 tot 10 uur per jaar: objecten tussen de 5 en 10 uur contour hebben kans op 5 tot 10 uur slagschaduw per jaar en daarmee meer kans op slagschaduw dan de wettelijke norm;
- > 10 uur slagschaduw: objecten binnen de 10 uur contour hebben kans op meer dan 10 uur slagschaduw per jaar en daarmee meer kans op slagschaduw dan de wettelijke norm.

Bij zonsopkomst en zonsondergang kan de schaduw van een windturbine aan de westkant en aan de oostkant ver reiken. Op afstanden groter dan twaalf maal de rotordiameter wordt de slagschaduw niet meer als hinderlijk beoordeeld.

Aan de noordzijde wordt het schaduwgebied begrensd omdat de zon in het zuiden altijd hoog staat. Aan de zuidzijde treedt geen schaduw op omdat de zon nooit in het noorden staat.

In de figuur hiernaast is weergegeven op welke momenten in het jaar en op de dag de slag de contouren betrekking hebben.

Windturbines

Windturbines worden aangeduid als WTG's (Wind Turbine Generators). Afhankelijk van welk type turbine gebruikt wordt in de berekening zijn de turbines voorzien van bepaalde eigenschappen, zoals de ashoogte, diameter van de rotorbladen, de berekende schaduwlengte en het aantal omwentelingen per minuut (RPM). Deze eigenschappen zijn van invloed op de slagschaduw.

Receptoren (gevoelige objecten)

Als zich in de door de slagschaduw getroffen uitwendige muren van gevoelige objecten (woningen, bedrijven etc.) ramen bevinden kan er sprake zijn van slagschaduwhinder. Om de potentiële en verwachte duur en periode van deze hinder te berekenen wordt er in het rekenmodel gewerkt met receptoren. Deze receptoren krijgen op basis van object specifieke informatie een bepaalde input mee:

- locatie: De locatie wordt bepaald op basis van coördinaten (noorderbreedte en oosterlengte);
- oriëntatie: Afhankelijk van waar de ramen van een object zich bevinden wordt de receptor op een windrichting georiënteerd. Dan krijgt de receptor een 'fixed direction'. Wanneer de ramen zich aan meerdere zijden van een object

bevinden, of wanneer niet duidelijk is waar de ramen zich bevinden, kan er gekozen worden voor een 'greenhouse mode'. In dit geval wordt de slagschaduw hinder op alle zijden van het object berekend.

- grootte: Afhankelijk van de grootte van een object kan de receptor specifieke maatvoering meekrijgen voor wat betreft hoogte, breedte, hoogte boven de grond e.d.

Worst case / verwachte hinderduur

Op basis van de turbineafmetingen, de gang van de zon en een minimale zonhoogte van drie graden boven de horizon, zijn de dagen en tijden berekend waarop slagschaduw kan optreden. De gang van de zon is voor alle dagen van het jaar bepaald met een astronomisch rekenmodel waarbij rekening is gehouden met de betreffende locatie (noorderbreedte en oosterlengte) op de aarde. De worst case hinderduur is een theoretisch maximum. Hieruit is de verwachte hinderduur berekend door het toepassen van correcties (zonnenschijn, oriëntatie en bedrijfstijd windturbine). Als gevolg van deze correcties is de verwachte hinderduur aanmerkelijk korter dan de worst case hinderduur.

Kalender per receptor (bijlage 4)

Op de kalender per receptor wordt voor iedere dag de *worst case* slagschaduw hinderduur weergegeven. Naast de dag in de maand staat, van links naar rechts, de tijdstippen van zonsopgang en zonsondergang, het potentiële aantal minuten slagschaduw, het tijdstip waarop de slagschaduw hinder begint en eindigt en met welke windturbine de hinder begint en eindigt.

Onderaan de lijst wordt de worst case slagschaduw hinder per maand gecorrigeerd naar de verwachte slagschaduw hinder in minuten.

Grafische kalender per receptor (bijlage 5)

Op de grafische kalender per receptor worden de gegevens uit de kalender per receptor (bijlage 4) weergegeven in een grafiek. Per receptor is te zien welke windturbines op momenten slagschaduw hinder kunnen veroorzaken. Hieruit is af te lezen welke turbine op een bepaald moment slagschaduw kan veroorzaken op de betreffende receptor en hoe lang dit potentieel duurt (worst case).

Kalender per windturbine (bijlage 6)

In de bijlage 'kalender per windturbine' wordt voor iedere dag de tijdstippen weergegeven waarop deze turbine slagschaduw veroorzaakt. Daarachter wordt vermeld hoeveel minuten dit in totaal bedraagt. Het kan voorkomen dat een turbine op een dag slagschaduw veroorzaakt op meerdere momenten en/of receptoren. In dat geval worden er meerdere reeksen tijdstippen en minuten weergegeven.

Grafische kalender per windturbine (bijlage 7)

In de bijlage 'grafische kalender per windturbine' worden de gegevens uit de kalender per windturbine (bijlage 6) weergegeven in grafiekvorm. Per turbine is te zien welke receptoren op welke dagen en tijdstippen in het jaar slagschaduw hinder kunnen ondervinden. Hieruit is af te lezen welke receptor op een bepaald moment slagschaduw kan ondervinden en hoe lang dit kan duren (worst case).

Idle start wind speed: Cut in wind speed from power curve

Table with columns for months (January to December) and rows for hourly time slots (08:46 to 17:24). It includes data for potential sun hours, sun reduction, operational time reduction, and wind direction reduction. A summary row at the bottom shows total values for each category.

Table layout: For each day in each month the following matrix apply

Day in month Sun rise (hh:mm) Sun set (hh:mm) Minutes with flicker First time (hh:mm) with flicker Last time (hh:mm) with flicker (WTG causing flicker first time) (WTG causing flicker last time)

Idle start wind speed: Cut in wind speed from power curve

Table with columns for months (January to June) and rows for days (1 to 31). Each cell contains a 2x2 grid of times (Sun rise/set and First/Last time with flicker) and a 'Sum of minutes with flicker' at the bottom of each month's data.

Table layout: For each day in each month the following matrix apply

Day in month Sun rise (hh:mm) Sun set (hh:mm) First time (hh:mm) with flicker-Last time (hh:mm) with flicker/Minutes with flicker

Calendar per WTG

Potential sun hours	501	453	381	332	267	244
Sum of minutes with flicker	17242	12380	5099	0	0	0

Table layout: For each day in each month the following matrix apply

Day in month	Sun rise (hh:mm)	First time (hh:mm) with flicker	Last time (hh:mm) with flicker	Minutes with flicker
	Sun set (hh:mm)	First time (hh:mm) with flicker	Last time (hh:mm) with flicker	Minutes with flicker

7. Calendar per WTG, graphical

Calculation: Slagschaduwberekening Bedrijventerrein De Geer
